

The NFL program example contains three classes. NFL, football team, and football player. The NFL contains football teams; and each football team contains football player.

- Each football player has the following properties: name, salary, and rank
- Each football team has the following properties: name, and a set football players
- The NFL has a collection of football players and a set of football teams

Implement the following options:

1. Add new football teams to the NFL
2. Add new football players to a football player team
3. Change football player rank
4. Print all the data of the NFL
5. Write a menu that enables all the functionality above

The solution can be found in the repository
